

Creating a healthy distance with plants

Growing apart can be a good thing

Plant displays to keep your workforce safe: using nature to create attractive, healthy barriers and demarcation in the workplace.

Partition large areas

- Reception & waiting areas
- Break-out & canteens
- Open spaces
- Desks & working areas

Demarcation

- One-way systems
- Hedge mazes for waiting in line
- Rows of plants for seating area barriers

SOCIAL DISTANCING

For the greener good

Plant and moss displays make ideal green and healthy physical barriers. They simultaneously improve mental wellbeing, cognitive performance and humidity levels. A natural alternative to more obtrusive barriers, they encourage your workforce to keep apart without creating an unnatural feel to the space.

The great green divide

Used wisely, plants and moss displays can help you to achieve a safe working environment for your workforce and guests.

Planted screens form physical barriers with additional aesthetic and health benefits, encouraging social distancing in a way that looks, feels and is natural.

Moss barriers are an easy way to divide, partition and demarcate large open-plan areas.

Needing very little maintenance but with natural good looks, they attract only the right kind of attention, forming part of the office design while helping your workforce to keep at safe distances from each other.

Plan for the future

Use plant displays in your new office layout, to help meet social distancing guidelines.

Creative green

Plant displays can form an office maze to encourage a safe flow around your indoor workspace.

Thoughtfully selected and positioned, plants can direct footfall without negatively impacting your office design.

Inspiration

We offer a range of plant displays to help your workforce maintain a healthy distance around the workplace.

Unobtrusive and healthy by nature, our designs can take the stress out of the new workplace rules.

A natural desk barrier

Double-sided moss or planted panels form an unimposing barrier without the feeling of complete separation from colleagues. Moss is a maintenance-free option while live plants provide clean air close up.

Limit airborne droplet transmission by raising humidity levels

The dispersal of airborne respiratory droplets is greatly reduced in higher humidity. Plants transpire up to 99% of the water they are given, so they are perfect for increasing indoor air humidity levels.

1 plant for every 3 people improves air quality
Humidity goes up 20%

Humidity for health

Increased humidity levels help our immune system by keeping our skin and mucous membranes healthier.

A healthier mucous membrane in the throat and nose helps trap particulate matter and pathogens, preventing their entry into deeper tissues, such as your lungs, as well as reducing sneezing.

It can also help reduce coughing by lubricating the throat.

Biophilia:
**Our innate need to stay
connected to nature**

Wellbeing

Bring nature indoors and instantly experience the biophilic benefits of plants.

Stress lowers and wellbeing rises when we have nature in our line of sight.
